

# Idea Fragments

By Miles Raven Alv Sunhede

From 2025 -->

# Del 1

1:

An economic idea I want to share:

I propose a global taxation system, which uses VAT. I call the system WOT — Wealth Optimization Tax. The core is constituting company value via AI, and incentivising healthy investments via VAT. Immediately I want to mention that AI is already being used in predicting stocks, but the problem is that many stocks that lead to a return, do not lead to world growth. That, is the problematic niche, I want to attack.

The secondary power of this system is that the VAT could be dynamic to balance the volatility of inflation out. The regular way is to increase interest rates on loans. As WOT mainly affects wealthy individuals who invest, this balancer would strengthen the lower class.

2:

A political idea I want to share:

Brain-scanning when functional, combined with AI could make a stronger democracy. Hear me out: a problem with today's politics is that you might vote for one party, but the other party has two opinions you like. If we could instead via AI pinpoint ideology from the brain, we could funnel this into an ideological map of the country. Then, AI would come up with different propositions for important matters, rate their ideological type, and then apply the population's ideological map on top of it. A letter of a person's values could be used instead of brainscanning as a decent replacement.

3:

Here is a political idea I want to share:

If one thinks about it, if AI will replace most jobs and a UBI-framework is implemented in society, people will have more freedom. Consequently, people might travel to municipalities or even countries that reflect their place on the political compass. If we take this to the extreme, an anarchist country might be formed, but highly doubtful as the other ideologies likely would attempt to put the brakes on that from occurring. Nevertheless, it is an interesting sci-fi thought-experiment. Will societies become more harmonic? Or will conflicts arise as our tolerance for others reduces?

4:

A cival idea I want to share:

Protests are more efficient when they are deliberate as in follow certain structures. It might be a utopian idea, even insensitive, but a central protest website would be fascinating. People discussing, outsiders giving their takes, deadlines being finalized after a quorum is reached whereby they know they are enough to win over the politicians. So much in society is organized and optimized, but protesting–not so much.

5.

A philosophical idea I want to share:

In my opinion following values leads to a sense of freedom. When one is somewhat beaten down, and cannot follow them; one feels trapped or the opposite of free. I translate this to the case of bullying. Bullies obviously do something, which is hardly aligned with any values, so one could say that they are unfree. To prevent bullying, society should thus be designed to foster free individuals

6:

A psychological idea I want to share:

I believe a reason that war occurs quite a bit despite being so unfathomable for the average person, is because of three levels of romanticism stacked. The first layer would be that leaders are charismatic, so they are inherently romantic in nature. Secondly, while in power, they are able to feel extremely meaningful, unlocking even more romanticism in them. And thirdly: during hostile situations, which politicians deal with, not only their own life, but for their country; a “we” and “them” mindset is embedded in the politician, which is characterized by romanticism also.

I will not go into more detail, as I believe this is the crème de la crème of an exploration I did in my mind, but yeah. I found it interesting.

7:

A political idea I want to share:

What if there was a political handbook on conduct? The main point of conduct, I wish politicians had would be to be honest with the temporal perspective of their ideology. In my head, a socialist and conservative might both have good points logically on a topic, but the difference being the time scope. So a voter could be misled into voting misaligned with themselves when confronted with the flurry of arguments of attack and persuasion tactics. Sometimes it might not be about socialism or conservatism, rather about now or later. I just wish the political game never would be the type of game it often is.

8:

## A political extrapolation from a law-incident

Dear Politicians:

As you all are extremely aware of, and perhaps a little guilty of, integrity across society is a major problem. I cannot offer a sole solution, but I think I have a partial remedy, which at its best–could have a ripple effect of good in society, and at its worst–exist as an empty tangent. Implementing it should be of little economic effort, yet the reward could potentially be highly economically impactful. That is, criminal behavior and corruption reduction would serve the state well.

Laws should be overarchingly structured in levels of severity, both in public and political articulation, removing the monolith: “The Law”. I recommend “Honorary customs”, and “Ethical behavior”. This, if synthesized, matches Turiel’s work on the conscience, that children grouped behavior into essentially immoral versus defiance after being experimentally exposed to different scenarios.

If I have caught all of your attention, excellent, if not–think of it this way: is it not all of your responsibility to turn every stone? I will get you started on this particular one by expanding its conjecture. As for signposting, I will begin philosophically, then introduce science, and afterwards present my most intriguing argument–finally ending reflectingly with an “Afterwords”. Before all that arguing, though, I want to establish that as by my novice research, all cultures have used a singleton for relating to the law. Some have levels of severity, or other types of categorisation, yet all under a singleton.

Philosophically: bad organization structure profoundly can impact the rate of bullying in work-places; thus, as the law is this meta-organisation just like leadership, it could have similar effect. I, additionally, believe that people with dispositions relative to surface-level components, have to take great leaps to think deeply. This connects to this topic since dispositions such as the relationship to the law are then tied to thought, and thoughts are, as known, connected to behavior. Finally, before delving into the science, let me give you all another take which you might resonate with. In every breakage of the law, there is likely a sense of thrill. If we were to mitigate that sensation, it very likely could reduce the scale tipping over toward disobedience–a result of proper categorisation.

First of all, I want to present the fact that language affects the brain in subtle, but meaningful ways (Sapir-Whorf hypothesis). It can affect perception. I, therefore, think that important and delicate subjects should have precise, appropriate wording. Secondly, I am aware that people throughout history have committed atrocities, even before the law was implemented. I, however, speculate that the law begets a tension that leads to breakage. This is supported by the fact that authoritarianism is associated with high homophobia and misogyny, usually cited via Bob Altemeyer (The Authoritarians). Producing causality is difficult; however, I remember interviewing a teacher from Uganda, who expressed how students there were more rowdy compared to Sweden. I theorized based on the context that it had to do with the strictness of rules that the kids experienced at home. Scientifically, this can partly be explained by Jack W. Brehm's (A Theory of Psychological Reactance) i.e. that the sense of limited freedom caused by rules results in a motivation to restore it, frequently via contrary behavior.

At this point you all might think to yourselves: can the semantics and categorization of the law truly have a lasting, powerful impact? Perhaps not. Nevertheless, you politicians think about the law immensely:

It is usually agreed upon that power can corrupt people. From there, I argue that without the feeling of the law as a politician's prerogative to impose and control, they might not corrupt as much. This can be linked to integrity, since when people view their role as imperative, they are more inclined to do whatever to dictate their ideology. It is a paradox, though, if they cared so much why would they not be honest? So if they cared less, were less serious; dare I even say less apathetic and more in tune with now basic human emotion, with the structural power not deviating the base human-form, would they take their job less seriously, but simultaneously more seriously?

I do not know. What I can merely offer is the thought that if there is an opportunity to optimize the wording, why not give it a shot? It could take decades to implement it into the culture. It could, also, be met with resistance from extremists needing to preserve whatever inch of culture they deem relevant. It is, however, unexplored territory and whilst naming gender-appropriate has become a larger political stride, use that as leverage for this.

After all, Sapir and Whorf would potentially agree with me. These esteemed individuals unfortunately do not live now, but their counterparts must live. I, furthermore, urge you to broaden your imagination for a few seconds: imagine a world with less rape because of a consentful naming of sex, imagine a world with less murder because the word of it is so long that no one bothers thinking about it. Alas, all of those are incredibly difficult to spread into society, but the law, yes the law, is more controllable. Begin adjusting the court to explicitly use the new wording I proposed in my thesis, and further if possible by coming to an agreement in the political sphere to use this terminology. It is a massive adaptation, and it could be difficult for politicians to match the exact appropriate severity for all the thousands of crimes, but again, it is a small economical effort with potentially high economical return. Approximation is fine, as the spirit is what matters in this instance. As a result of all this, corruption and criminal behavior could decrease by one percent. So what do you say, dear politicians? Dare you all give it a shot?

Sincerely, Miles Raven Alv Sunhede

Afterwords: I originally wanted this structure to be in place for the law so that it would be aligned with my conscience. The extrapolation was that classmates I drove with were cheating with parking-tickets, and it exacerbated my conscience more than reasonably, so I wanted to systemize this and imprint it onto society. Fortunately, Douglas N. Husak’s respected work on overcriminalization leading to declining respect for the law (Overcriminalization: The Limits of the Criminal Law), whereby my recommendation could semantically change this at least, as well as Tom R. Tyler’s award winning work (Why People Obey the Law) that argued that compliance to the law is built on its legitimacy, which possibly alignment with the conscience could contribute to, both make this a worthwhile discourse; however, who knows.

## Distillation into experiments

Use children for the experiments. Ask them for their preconceptions about law, and right and wrong. We act under the assumption that for children school rules are like the law. We can then “play” different societies in different schools. One type which uses framing of their rules as ethical/honorary, and the other frames the rules as if they are under a single monolith. Children as subjects, removes the otherwise adults who are under my thesis already ingrained by the monolith of the law. As ethical and honorable might be abstract to children, the wording will be mean and rude. A pool of schools will be selected and randomly distributed their construction. Both schools present the rules in the same fashion, with one categorizing them while the other not.

# Del 3

9:

Faith is a strong belief in God. In order to believe If something is or is not logic is required. Thus faith is inherently logical. Faith is as if you funnel all your values into a concentrated belief. That is because optimism, like faith, is about a wish for a better world. So faith also requires values. Meanwhile, values are feelings and logic, as they are sensed like feelings but can be reasoned at. So what I mean to say is that if one breaks it into parts, faith has 2 logical components and 1 feeling component, or 1 logic and 1 value component. My idea is thus, that someone who is very logical has a high potential in faith. This would also mean that highly logical people have a strong sense of justice as long as they have the feeling component. And lastly, that spreading logic is a way to spread faith.

10:

A pitch to any prevalent social media platform who wishes to listen: You travel to an electric lake, and scroll on your platform and find a story/poem/essay inspired by or related to this spot. And you could only see it because of the romantic travel. I imagine it as creating a world in an era of adventurism, of discovery, legacy, and reciprocity. It would work like the following.

Compared to instagram stories, or tiktok reels, this would be a more thoughtful, culturally beautiful way to share. One would simply write a text with more effort than usual social media posts, and have it leave a mark in the area, being read by your friends, and people who stumble upon the location willing to read it. The most important caveats: one, incentive; two, quality.

As for incentive, it can be framed as sharing an effortful piece to your friends while also simultaneously leaving a mark on the world. People write stories/poetry/essays but rarely on social media platforms. This could be the hook for people to do that; thus, you, the company, will take over more of the market. Will people even do it?

Yes, since there will be a feedback loop of someone discovering your piece of art, and then sharing back something from a similar location. This would trigger a wonderful sensation. Imagine it: you write a poem about an electric lake you visited once, combined with the stories that occurred there. And then a year later someone finds this and replies with a similar experience. Specifically, the sense of being discovered, contributing to a world of discovery, being reminded, being reciprocated by a similar piece is the joy this would induce.

Lastly, as for quality, use an existing model like automated moderation, minimum text, and a like system.

11:

I would like to contribute to a debate: I once had a teacher, who did research on the side. He found that autistics are for some reason more comfortable with speaking English than their allistic peers. Mind you, English was not their primary language. The obvious conclusion is likely that autistics feel more socially isolated; thus, find the internet as a part of their identity formation, where English dominates. Because the internet, as usually argued, has a net-good for culture, we are losing an opportunity for better identity formation, especially autistics who often do not have the same opportunities as others. The debate this confounds with is having a safe social media platform for younglings amidst social media ban, but I urge them to consider the autistic perspective.

The implications are, either a stronger reason to compliment social media bans with a safe social media platform, or to its extreme: if the identity forming is very important, allow autistics to continue using these platforms, while others not; or have a safe platform for the autistics while the other kids because of foreseen consequences do not get one. Why, though? Real world socializing is assumingly more rewarding than on the internet, but if it is unavailable or difficult for autistics, it results in variation of need. Social media still has consequences of reduced focus as well as internet addiction, and likely higher risk for mental illness. However, I argue that depending on the importance it is for autistics, they might need a special platform.

12:

What if most misdemeanors come from wanting values imposed on oneself? I believe this because of a chain of logic. 1: Values are important for identity, and people who misbehave often have weak values. 2: At the same time, one is often faced with imposition of values at misconduct. 3: To further this idea, a child learns that this is how it goes when one misbehaves, so it is rooted deep into human psyches.

Because some criminals are clearly anti-social, their misdemeanor might be related to their twisted nature, while other criminals might be just unaware of what they did wrong. This combined with the introductory idea, is a trifecta of causes for criminality.

Let us connect this idea to a therapy, which makes sense as treatment for the “need value imposed on them types”, namely MRT (moral reconation therapy), basically discussing morals with the criminal. I propose that instead of the neutrality the professional has when doing this on the patient, be directive as the idea is that they want values imposed on them. Then it can be further optimized by psychological theories like, start with value imposition, then discuss, then end with value imposition; as beginning and end usually have the most power in a timeframe, as by the primacy and recency effect. Ideally have the professional be someone the criminal can admire as it is known that that helps with emulation. Lastly, have it be close to the incident since if they wanted a value imposition, and if they as kids learned to be imposed right after the incident, it should make it more powerful.

13:

God cannot sin, yet he made the angel which would spiral into Satan. In comparison, all humans sin to some degree, even saints. That is because one by just living indirectly in one way or the other hurts others. So why is God exempt, if we treat God and humans with the same accountability, and believe the words of the Bible as truth. My conclusion is that either God is causation itself, or resides in such a domain. However, God is all seeing which is the opposite of a realm of directness since directness is near-sighted. This is the paradox I want to lift, and eventually resolve.

One can abandon further inquiry by saying: “we can never fully understand what God is”. I disagree, as everything which has existence affects something. And as science develops, we are able to measure that something more and more. On the other hand, one can further the inquiry, by asking “Does this mean God is not a single entity?”. He is known as the trinity. This would mean one or two parts of the trinity lives in the realm of directness, and one or two parts live in the all-seeing realm.

I would offer the Spirit to live in direct causation, as the son and the father are beings who at the minimum can view slightly into the future. And that the father is the all-seeing one, as he is often described as transcendental.

In conclusion, in theology this hints that The Holy Spirit is causation itself or lives in such a realm. Finally, this all ultimately points toward that The Holy Spirit created the angel, which would become Satan.

14:

I will define maturity as “One’s ability to positively influence oneself and others, as by principles”. The first principle will be a disposition to logic, which already can be measured, namely by Actively Open-minded Thinking (AOT). One could summarize it as an explorative relationship to logic. Second, one’s disposition to emotion. Amidst emotion, how capable is the person to derive the content from the emotions and organize it via logic. In order for emotion to be organized at all, there needs to be content so there needs to be a baseline of emotion in the individual for measurement. Thirdly social, logic and emotion do most of the work, as traits such as cooperation and compromise naturally follow the previous principles. Courage specifically to be influenced and influence others is the thing, which we want to measure here. Lastly, the ego: I personally do not know the importance of this. I will, therefore, not try to theorize on it here. I only know that it is intertwined with all the other dispositions.

15:

## A goddess interest

Dear politicians of Kazakhstan!

As you know a split population rather than a unified one is undesirable. Kazakhstan’s language situation is undesirable. That is, language and identity shaming permeates Kazakhs. Any reasonable person would know that encouragement is a better tool for change. But instead of lecturing these waywards!, there is a more foundational problem in your politics. Namely, that national identity is not firmly tied to the author’s, the people's autonomy. I, therefore, propose alongside the upcoming content, to engage identity politics–particularly language–via direct democracy more. After all, as per Pew Research Center's study, language is the greatest factor people seek in someone being a part of their nation.

I am not from your state, so why should you listen to me? In other words, why should an outsider influence such a touchy subject? You have no reason to read this, you purist!, leave.

I have attentively listened to my friend from Kazakhstan. She told me not only that it is a collectivist country, but also a country where people want to appear richer than they are. I would translate those phenomena as, people not minding their own business as well as having a hierarchy complex. These two conditions of the country I believe influence the “shala-Kazakh”, incomplete Kazakh situation, where people are often asked “Qazaqsyn ba?”. In English it means “Are you Kazakh?”. A will, to place status on people, still why?

The key word of why is dignity. I would describe dignity as contributing to steadiness. To me it feels close to justice. It is like knowing that I deserve justice, am just, and want the world to be just. To me dignity is compared to other feelings, a layer over the whole body. Dignity is confidence that justice is correct. It of course feels like that golden righteousness if one would ascribe it a color. If justice is inflicting dignity upon the world, dignity is the source it gets the flame from.

I will get to why a “just” feeling is shaming the populace. Phenomenologically: I feel that dignity is tied to self-esteem since when dignity is breached it can affect self-esteem. The fact that being violated affects self-esteem has many causes, like expected shame from the public, but also I feel because it leaves an unwanted mark on oneself. This hints that disallowing someone from their character: that their identity is dignity’s ward. My overarching point is thus that identity-politics is a matter of dignity. And since dignity is related to justice, the way to handle identity politics should be via the system which feels the most just to individuals' lizard brains.

Considering the point of view of the waywards, I want to say that I understand why you say “Qazaqsyn ba?”; it indirectly affects your identity. But notice that if you resonated with my text, the part of that dignity relating to justice, maybe the phrase is actually inappropriate? I personally believe justice of this type should be solved democratically, not via scrutiny and shame. Dignity is complex, so it is something many do not bother thinking about–and it affects one apparently–but now you have.

I speculate that if people felt not only a right but strong encouragement to be themselves more, their identity would get stronger; thus, be less prone to the cultural split’s indirect effect of the identity’s erosion. This is what I mean by, “I wish identity to come mostly from the inside”, and of course by a special group of people you allow into your personal sphere. If this is robust enough, I believe a lot from the outside can be transformed into strengthening that core, making it feel less like infringing on identity, rather raw material. That is my idea for an ideal world.

Now, politicians, you have heard my examination of this problem. I work on a few assumptions: first, that identity is dignity’s ward; secondly, that dignity is the source of justice; thirdly, that the lizard brain is where tribal dispositions live and when fragile dignity is poked such tribalism comes forth; fourthly, direct democracy will be more fitting than representative democracy because the primitive brain resides so closely to identity. Before you leave, though, you pluralist!, I have a threefold structure of why direct democracy will extinguish the social issue by many degrees.

I would say referendum is imperative because the feeling of being in control is what I have proposed is good for dignity and so for identity, as long as they do not infringe on human rights or democracy. It also teaches that dignity is related to justice, which some of those practising the “Qazaqsyn ba?” scrutiny seem to be missing. Sure representative democracy does that but you engage more when it is direct democracy. Lastly, the discussion part of the direct democracy, before voting, will train dignity as it is a complex feeling and those need processing more than simple ones. Threefold.

With respect,

Miles Raven Alv Sunhede

# Who am i?

0:

A never-ending staircase of school is reality. An 8 year old boy with long hair talks with a friend and teacher, about how “Ahh I miss the good old days”, jokingly as he knew some adults thought this way, but with underlying melancholy because he felt so himself. Like a bee sting, it felt like doom, a sensation of being trapped, a mindset of pushing through. His first encounter with reality.

School was so troubling, as if his body reacted with “I must become school”, and “I must become numb”. In a time warp, a glitch in the matrix, such would become the prophecy. 10 years later: the prelude of psychosis; the mind is plastic, but it came at a cost. 5 years before that, bedridden; let the numbing begin. 3 years later: as if his soul separated from his family, teachers felt as if role models–even parents. The process completed. The boy had become school, with a scholarly body. 4 years later, psychosis. A few months later, treatment. The circle was now complete; society had formed the individual and instead of changing the underlying issue, he had received palliative treatment, a palliative resolution for society.

Reality–*sigh*.

But all that does not matter. Somewhat hubristically I feel I am justice, I feel that I am melancholy, but most of all I feel that I am nice. So despite my identity being warped I feel surprisingly like myself. I am a good friend, someone who wants to contribute to the world. I am me. Not only a bundle of qualities.

A teacher recently complimented a quality of mine, essentially calling me moldable as in being able to learn and grow. I thought to myself: “Isn't everyone like this?” Teachers have told me I have potential. Is potential to adapt to academic standards really a strength? Teachers have told me that I should become an engineer, a poet, an economist, a lawyer, but I do not want any of this. What do teachers know about me? Those who work for the municipalities, forcing me into a sort of pupa. “I have already done enough adaptation to you, leave me be”, is how my body reacts. Independence is apparently still not fully there yet.

Feeling independent was never easy alongside its relative, my fragile identity. The crux of the psychosocial situation was perhaps the hatred I felt toward my family, speculatively to combat this duality. During the psychosis one thing which made me feel comforted was watching k-pop street dancing events on Youtube. I saw a video of one in Düsseldorf Germany. My psychologist would regularly mentor me and encourage me. I decided with a will to live in my belly amidst suicidal thoughts from the head, to travel to one of these events from the airport in Sweden. I was temporarily mute. I was scared. I was solo. Even though it did not cure me, I to this day wonder if it set a core to a strengthened identity.

After all this–the psychosis, the fragile identity, but especially when becoming something independent, someone who does not need to adapt blindly–I found that I love logic. Granted, I have always had a predisposition to liking it, but it consolidated: in psychosis one detaches from logic, a fragile identity can barely think for themselves thus needing logic, and to be independent one needs to carefully navigate the world via logic. I love logic so much that spreading it I deem my vocation. I hunger for it. I wonder if there is a job that fosters this in the world.

A never-ending staircase of school is reality. The same boy who shed a tear, and was asked “Why are you crying?” while entering class, now loves life, particularly school. He is brightly optimistic for the future, his dream of becoming — *a math teache*r. Teachers like to say: “Once my student, forever my student”. For me, “Once in school, forever in school”.
